

214 PRACTICAL 4 DEMO STRUCTURE (TASK7)

1. Mention the Participants of our System (Team)

- Present the UML:
 - Iterator - Bheki
 - Why an internal or an external iterator?
 - Composite - Thando
 - Decorator - Thando
 - the differences in the attributes and operations
 - State - Yash
 - The different states how they each act differently

2. Ownership decision (Team)

- Thando will explain how/why the the phase component is responsible for deleting its children and how it does it recursively
- Bheki explains phase component that creates the iterator is responsible for deallocating it and that they don't own anything and only point to a phase object (client deallocates them)
- Yash will explain that a Task component is responsible for deleting its state

3. Traversal State (Yash):

- describe using the code or however you'd like to map the state transitions and how a new case flows from assigning to completed and the new attributes and operations it has access to you, essentially showing the change in behaviour

4. Trace an Activity Diagram (Yash):

trace the first activity diagram using the runtime scenario as a example.

5. GDB and Valgrind Evidence (Bheki):

- present the screenshots of the segmentation fault and explain how changing the traversal structure fixed it and using breakpoints and the next command in gdb fixed it

6. Docker (Bheki):

- build and run the docker image

6. Git History (Team):

- Just pop in with any significant commits you made
